InfoLedgr.

Setup guide

Your personal income, expense & budget tracker, on your phone and laptop, with your data in your own Google Drive.

💻

A laptop or computer
for the one-time setup (the Google Sheets phone app can't do it)

🔑

A Google account
the same one you use for Gmail or Google Drive

⏱️

About 10 minutes
once. After that, you mostly use your phone

1 Open the app

2 Copy your Sheet

3 Set it up

4 Turn it on

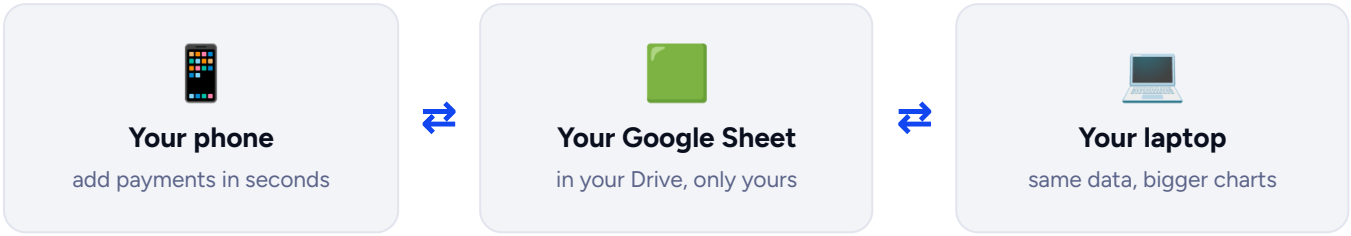

5 Connect

6 Add to phone

🔒 **Private by design.** Free, no ads, no bank login. Your money data is saved in a Google Sheet that only **you** own. Not even the person who shared this app with you can see it.

How it works

InfoLedgr is a website that works like an app. Everything you record is kept on your device and copied to **your own Google Sheet**, which keeps your phone and laptop in sync and doubles as your backup.

The 6 steps

1 **Open the app and choose your currency** — ₦, €, £, $ or another — 1 min

2 **Make your own copy of the InfoLedgr Sheet** — One click: "Make a copy" — 1 min

3 **Set up your Sheet** — From the InfoLedgr menu, then allow access — 2 min

4 **Turn it on (deploy)** — A few clicks in Google's "Apps Script" page — 3 min

5 **Connect the app to your Sheet** — Open your personal connect link — 1 min

6 **Put InfoLedgr on your phone's home screen** — It then opens like any other app — 2 min

💡 **Do it all in one sitting on your laptop,** using the **Chrome** browser if you can. Keep this guide open next to it. Where you see a highlighted button in the pictures, that's what to click.

⚠️ In step 3, Google shows a warning that the app **"isn't verified"**. That's expected: it's your own private copy, not a public app from a company. The guide shows exactly what to click.

1 Open the app and choose your currency

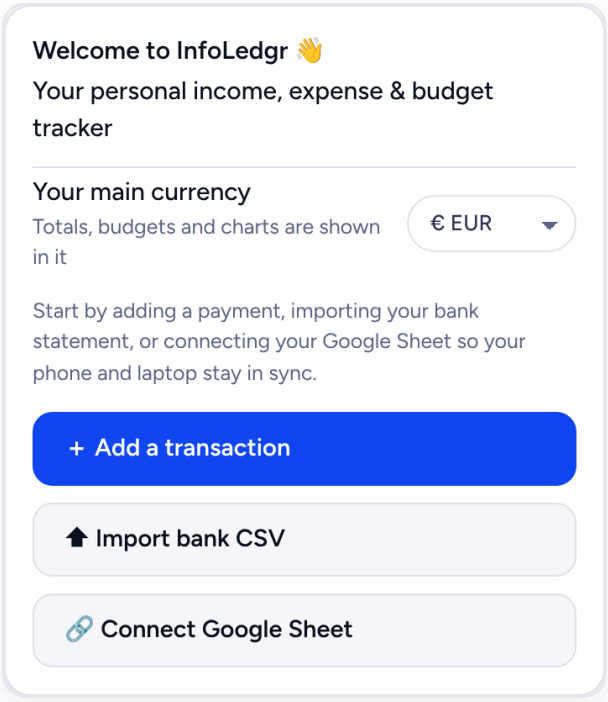

On your laptop

a Go to infoledgr.pages.dev

b On the **Welcome** card, find **"Your main currency"**

c Pick the currency you mostly use, e.g. **₦ NGN** if you live in Nigeria, **€ EUR** if you live in Germany

💡 Payments in other currencies are fine too. You choose the currency each time you add one, and InfoLedgr converts it for your totals.

The welcome card

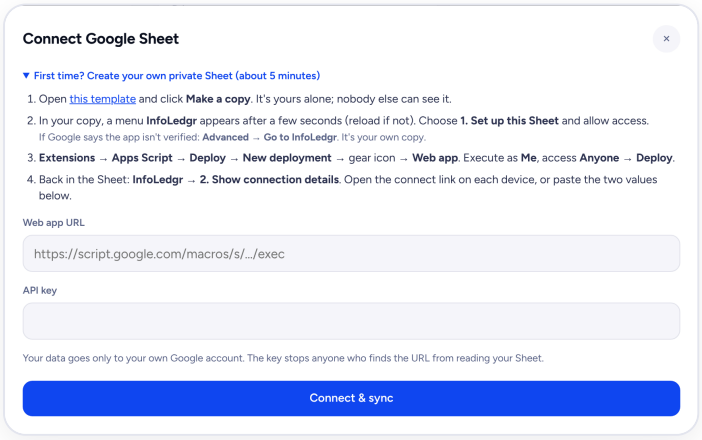

2 Make your own copy of the InfoLedgr Sheet

Your private place for your data

a In the app, click **Settings** → **Connect Google Sheet**. The setup steps are shown there too.

b Click **this template**, or open this link directly:
docs.google.com/spreadsheets/d/1qaSJbqzGkqlc1ZIubtk9nCQ_32ZcLCmWKxRN7Ex6hgo/copy

c Google asks **"Would you like to make a copy?"** → click **Make a copy**

✅ Your copy opens in a new tab, called something like **"Copy of InfoLedgr (template)"**. You can rename it, e.g. **"My InfoLedgr"**.

🔒 This copy belongs to you. Nobody else, including whoever shared the template, can open it.

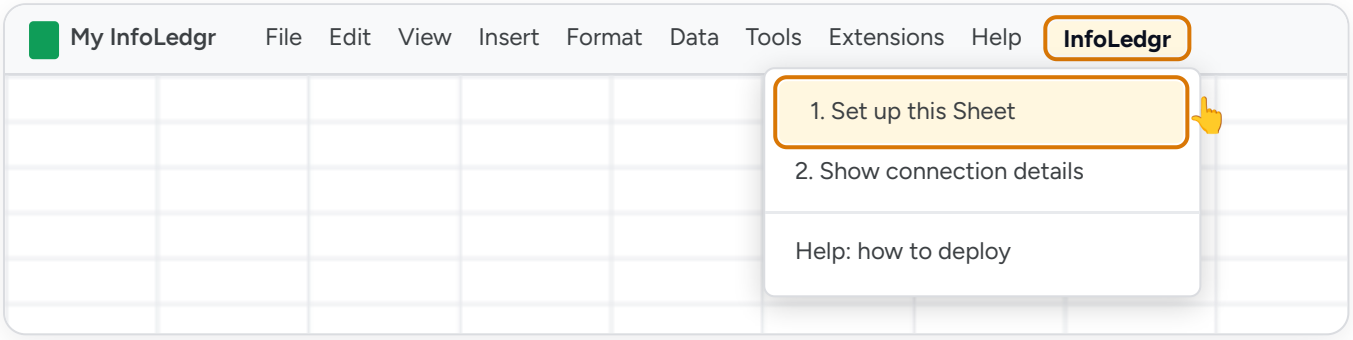

Keep the app tab open, you'll come back to it in step 5.

3 Set up your Sheet

In your copy of the Sheet

a Wait about 5 seconds. A new menu called **InfoLedgr** appears at the top, after "Help". Not there? Reload the page.

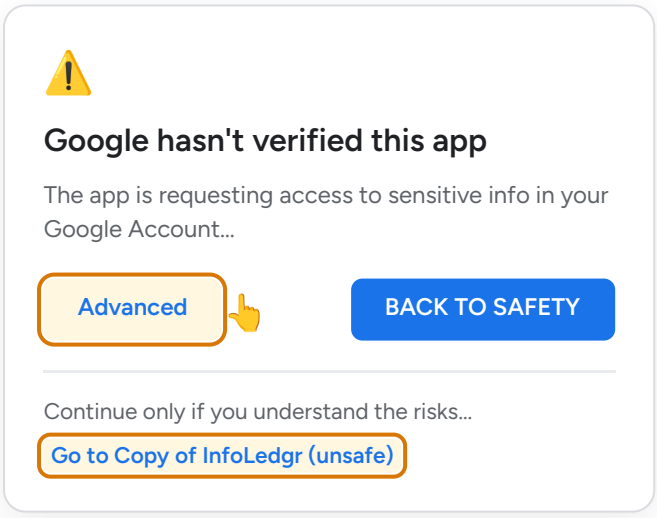

b Click **InfoLedgr** → **1. Set up this Sheet**

c **"Authorisation required"** appears → click **OK** / **Continue** and choose your Google account

d Google shows **"Google hasn't verified this app"**. Click **Advanced** (small link, bottom left), then **Go to ... (unsafe)**

e On the next screen, check the boxes / click **Allow**

🛡️ **Why "unsafe"?** Google says this about any script it hasn't reviewed, like a small home-made tool. This one runs in **your** account, on **your** Sheet, and sends your data nowhere else.

InfoLedgr asks to:

- **See and edit your spreadsheet**: to save your transactions
- **Create files in Drive**: for receipt photos (optional)
- **Connect to an external service**: to check your setup

✅ You'll see **"Your InfoLedgr Sheet is ready"**, and new tabs appear at the bottom: Transactions, Categories, Goals...

4 Turn it on (deploy)

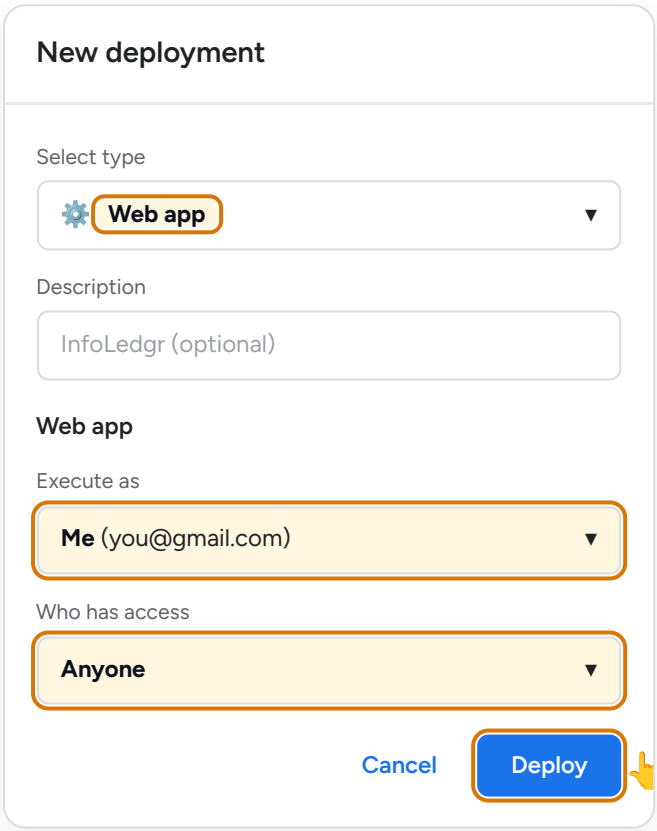

This lets the app talk to your Sheet. You only do this once.

a. In your Sheet, click **Extensions** → **Apps Script**. A new tab opens with code. **Don't change anything there.**

b. Top right: click the blue **Deploy** button → **New deployment**

c. Next to "Select type", click the ⚙️ **gear** → **Web app**

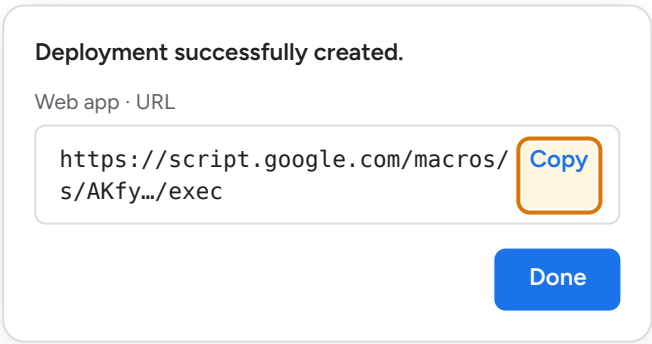

d. Set **Execute as: Me** and **Who has access: Anyone** → click **Deploy**

⚠️ Choose **"Anyone"**, not "Anyone with a Google account" or "Only myself", or the app can't connect. Your data stays protected by a secret key only your devices have.

If Google asks you to authorise again, repeat what you did in step 3 (Advanced → Go to... → Allow).

e. Google shows **"Deployment successfully created"**. Under **Web app**, click **Copy** next to the URL. It ends in `/exec`

💡 You can close the Apps Script tab now. You'll never need it again, unless you're told to update InfoLedgr's Sheet script (rare).

5 Connect the app to your Sheet

Back in your Sheet's tab

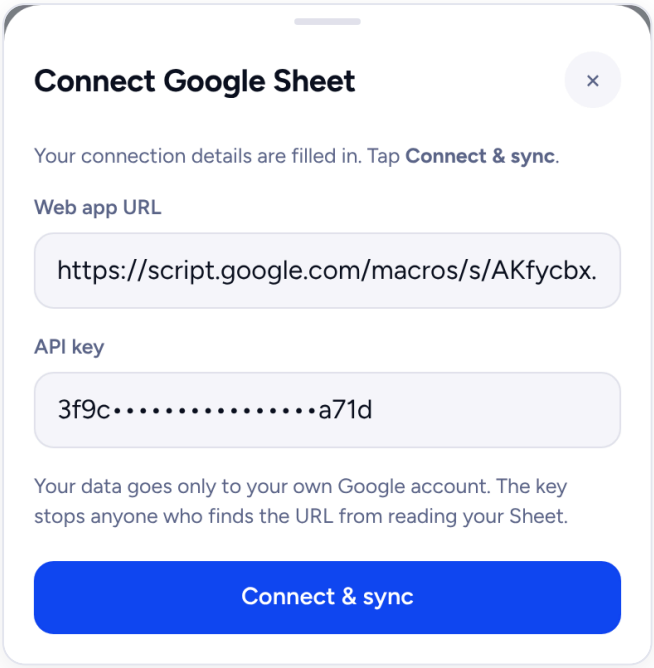

a. Click **InfoLedgr** → **2. Show connection details**

b. If it asks for your **Web app URL**, paste the one you copied in step 4 → **OK**

c. A box shows your **one-tap connect link**. Click inside it, copy it (**Ctrl+C**, on Mac **⌘+C**)

d. Paste it into your browser's address bar and press Enter

e. InfoLedgr opens with your details filled in → click **Connect & sync**

After opening your connect link

✅ You'll see **"Connected — your data is syncing ✓"**, and the sync button gets a green dot.

🔒 **Keep your connect link private.** It unlocks your data, like a key. Only send it to yourself.

6 Put InfoLedgr on your phone

So it opens like a normal app

a. Send your connect link **to yourself**, e.g. in WhatsApp "Message yourself", or by email

b. On your phone, open the link → tap **Connect & sync**

🍎 iPhone (Safari)

If the link opened in WhatsApp's browser, tap ⋯ → **Open in Safari** first.
Then tap the **Share** button ⬆️ → scroll down → **Add to Home Screen** → **Add**.

🤖 Android (Chrome)

If the link opened inside WhatsApp, tap ⋮ → **Open in Chrome** first.
Then tap ⋮ (top right) → **Add to Home screen** or **Install app** → **Install**.

💡 Using a second laptop or tablet too? Just open the same connect link on it. Everything stays in sync.

🎉 You're set up. Your first 10 minutes

➕ Add a payment

Tap the blue **+**: amount → category → **Add**. About 5 seconds.

🎯 Set budgets

Plan → **Budgets** → **Edit all budgets**. You're warned at 80%.

🔁 Add regular bills

Plan → **Recurring**: rent, salary, subscriptions post themselves monthly.

🛟 Create a goal

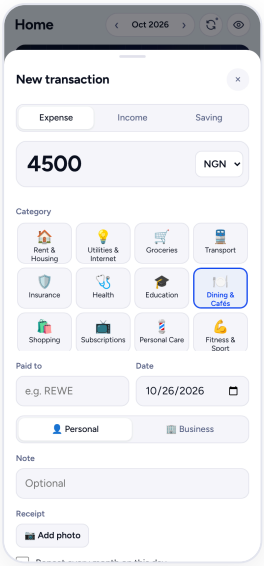

Plan → **Goals**: it tells you how much to save each month.

⬆️ Import your bank

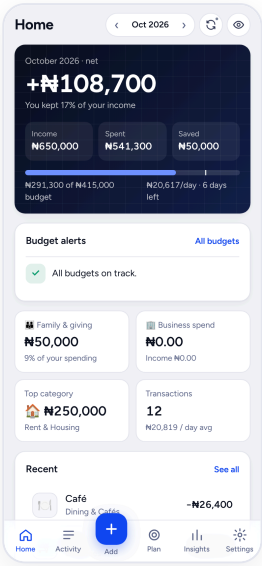

Activity → **Import bank CSV**, using your bank's CSV/Excel export.

🔐 Set a PIN

Settings → **PIN lock**, on each phone.

Adding a payment

Your dashboard

If something doesn't work

WHAT YOU SEE	WHAT TO DO
No "InfoLedgr" menu in the Sheet	Wait 10 seconds and reload the page. Make sure you're in **your copy**, not the template.
"Google hasn't verified this app"	Normal for your own copy: **Advanced** → **Go to … (unsafe)** → **Allow** (step 3).
"Could not connect: Failed to fetch"	In Apps Script: **Deploy** → **Manage deployments** → ✏️ → Who has access: **Anyone** → Deploy. Check the URL ends in `/exec`.
"The key doesn't match this Web app URL"	The URL and key came from different Sheets. Use **InfoLedgr** → **2. Show connection details** in **your** Sheet, and copy the URL from Apps Script opened **from that Sheet** (Extensions → Apps Script).
"That Web app URL belongs to a different Sheet"	Same fix as above: open Apps Script from inside your own Sheet and copy its URL.
Phone shows old data	Tap the sync button (circular arrows) at the top, or close and reopen the app.

💬 **Still stuck?** Send a screenshot to the person who shared InfoLedgr with you. Never send your connect link or API key; nobody needs it to help you.
